

MongoDB – Instagram Clone

Commands with Expected Outputs

1. Create and switch to insta_clone_db

Command:
use insta_clone_db

Output:
switched to db insta_clone_db

2. Create the posts collection

Command:
db.createCollection("posts")

Output:
{ ok: 1 }

Command:
show collections

Output:
posts

3. Create stories and insert a sample story

Command:
db.createCollection("stories")

Output:
{ ok: 1 }

Command:
db.stories.insertOne({
 username: "aruna",
 image_url: "https://example.com/story.jpg",
 timestamp: new Date()
})

Output:
{
 acknowledged: true,
 insertedId: ObjectId("...")
}

Command:
db.stories.find()

Output:
{
 _id: ObjectId("..."),
 username: "aruna",
 image_url: "https://example.com/story.jpg",
 timestamp: ISODate("2026-09-11T...")
}

4. Drop stories and verify

Command:
db.stories.drop()

Output:
true

Command:
show collections

Output:
posts

5. Drop the entire insta_clone_db database

Command:
use insta_clone_db

Output:
switched to db insta_clone_db

Command:
db.dropDatabase()

Output:
{ ok: 1, dropped: "insta_clone_db" }

Command:
show dbs

Output:
admin ...
config ...
local ...

Note:
insta_clone_db should NOT appear in the database list.

Complete Command Sequence

```
use insta_clone_db

db.createCollection("posts")

db.createCollection("stories")

db.stories.insertOne({
  username: "aruna",
  image_url: "https://example.com/story.jpg",
  timestamp: new Date()
})

db.stories.drop()

show collections

db.dropDatabase()

show dbs
```
